## Abstracts

Railway batteries are generally used for rolling stock or stationary applications. Rolling stock batteries are used for starting locomotives, lightings, and on-board auxiliary systems used in engines and coaches; whereas, stationary batteries are used as emergency backup power for railroad crossings, signal towers, and signaling systems. Most railway coaches (AC/non-AC) are self-generating systems where the electrical power is derived separately from alternators driven by axle through the V-belt drive, as long as the coach is moving ahead at maximum full load output speed of alternators. However, when the coach is stationary or moving at lower than maximum full load output speed, the entire coach's electrical load (including AC) is met by a battery. The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Battery for Railways market covering all its essential aspects.
