Abstracts

Blood components refer to products derived from platelet-rich plasma or whole blood. Blood components such as platelets, plasma, red blood cells, and white blood cells are derived from blood by the process of phlebotomy or hemapheresis through the technique of differential centrifugation. These blood components are separated from whole blood in hospital laboratories and blood centers, and are administered to patients suffering from various diseases through transfusion. The whole blood is often collected and separated into major components before transfusion. However, automated collections are becoming increasingly popular nowadays and only blood components that are needed for transfusion are collected.
