Abstracts

Bridge Rectifier converts the alternating current generated by the alternator into direct current, so as to supply power to the electrical equipment and charge the battery, and restrict the battery current from flowing back to the generator to protect the generator from being burned by the reverse current. The bridge rectifier circuit overcomes the disadvantages of the full-wave rectifier circuit that requires the center tap of the transformer secondary and the diode to withstand the back pressure, but additionally uses two diodes. With the rapid development of semiconductor devices and the low cost, this disadvantage is not prominent, and thus bridge rectifier circuits are widely used in practice.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Bridge Rectifier market covering all its essential aspects.
