## Abstracts

Calcium formate is calcium salt of formic acid. It is typically odorless. Calcium formate exists as a white, free-flowing, crystalline solid. It is also known as formic acid calcium salt, calcium diformate, or calcoform. The molecular formula of calcium formate is  $C_2H_2CaO_4$ . The salt can be produced synthetically from high-temperature and high-pressure reaction between calcium hydroxide and carbon monoxide. Calcium formate is also available industrially as a byproduct, from the preparation of pentaerythritol and other polyhedric alcohols and of disodium dithionite. It is a handy source of calcium and formate ions for aqueous solutions. Calcium formate is non-hygroscopic and it has low toxicity. The salt may cause irritation to skin and eyes. It can also cause gastrointestinal irritation with nausea, vomiting, and diarrhea.
