Abstracts

Since calixarene is a class of macrocyclic compounds with unique hole structures, it is particularly important as a target for mimetic enzyme research. It has been called the third generation of host compounds after crown ethers and cyclodextrins. In fact, compared with crown ethers and cyclodextrins, calixarene does have many characteristics: 1. It is a kind of synthetic oligomer, which has a large degree of freedom in the adjustment of the pore structure size; Derivatization can be carried out from the phenolic hydroxyl group. Moreover, the reaction can be carried out on the benzene ring, and a large number of derivatives can be obtained to meet various needs; 3. It can form a host-guest inclusion compound with ions and neutral molecules, which is a valency ether and a ring. The length of both dextrin; 4. It has good thermal stability and chemical stability, and its solubility is poor. After derivatization, some derivatives have good solubility; 5. Its synthesis is relatively simple, and it is expected to obtain a relatively inexpensive product.
