Abstracts

The ceramic infrared heating system consists of a resistive thermal conductor that is fully embedded in a suitable ceramic material. Because it is fully embedded in the ceramic, the energy generated by the thermal conductor can be transferred to the surrounding material, which prevents the thermal conductor from overheating and extends its useful life. The material used to embed the thermal conductor must be insulating and have good absorption and radioactivity over the set range of infrared radiation. To meet this requirement, ceramic material infrared heaters can be made into different geometries
