## **Abstracts**

The ceramic infrared heating system consists of a resistive thermal conductor that is fully embedded in a suitable ceramic material. Because it is fully embedded in the ceramic, the energy generated by the thermal conductor can be transferred to the surrounding material, which prevents the thermal conductor from overheating and extends its useful life. The material used to embed the thermal conductor must be insulating and have good absorption and radioactivity over the set range of infrared radiation. To meet this requirement, ceramic material infrared heaters can be made into different geometries

Based on the Ceramic Infrared Heat Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
