## Abstracts

CAR T-cell therapy is a cancer treatment that uses a patient's own immune system cells, called T cells, after these cells have been modified to better recognize and kill the patient's cancer. The T cells are engineered in the laboratory and then expanded to large numbers and infused back into the patient. This type of treatment transfers an immune system into the patient that is capable of immediately killing the cancer. CAR stands for chimeric antigen receptor, which represents the genetically engineered portion of the T cell. The CAR part of the T cell contains proteins that allow the T cells to recognize the specific cancer cells as well as become highly activated to kill the cancer cells.
