## Abstracts

Ion-exchange membranes in chlor-alkali process (also called ion exchange membranes in chlor-alkali membrane cell process) are the synthetic membranes employed to produce chlorine (Cl<sub>2</sub>) and alkali, sodium hydroxide (NaOH) or potassium hydroxide (KOH) by electrolysis of a salt solution. These membranes are permeable to either positively or negatively charged ions in aqueous solution used in the chlor-alkali industry. The membranes that are selectively permeable to positively charged ions are usually named cation-exchange membranes (CEM), and membranes selectively permeable for negatively charged ions are called anion membranes (AEM). The selectivity occurs due to high concentration of immobile (fixed) ions within the membrane body.
