Abstracts

The clad plate is a multi-layer plate that combines a carbon or low alloy steel plate (backing or backer) with a thin layer of corrosion-resistant grade (cladding or clad). Clad plate combines the high mechanical properties of the backing and the high corrosion resistance of the cladding. The clad plate is produced by bonding two or more metals together into a single steel sheet or plate. Depending on specific requirements, various cladding or backing materials such as a specialty metal, like copper or stainless steel, can be roll or fusion bonded to a base metal, such as carbon steel or low alloy steel, to produce a metallurgical-bonded clad.
