Abstracts

Closed die forging, also known as impression die forging, is one of the forging types for small or medium metal components. Close die forging is a plastic deformation process where, unlike in the open die forging process, the material is forced to flow in a closed shape called die. Compared to the open die forging, the close die forging (said also hot drop forging) can achieve more complex geometries, very much close to the dimensions of the finished component. The plastic deformation is given rapidly through some shots which force the material to fill the shape of the die. The process is performed at the plastic temperature of the material in use without intermediate re-heatings.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Closed Die Forging market covering all its essential aspects.
