## Abstracts

Lamination process can be divided into cold (cold pressure) lamination, heat (heat live) lamination and liquid lamination according to the cold and heat, pressure conditions and materials. The heat lamination technology refers to the heat activation of the pre-coated adhesive on the film, which bonds the film and the printed product together; and the cold lamination presses the adhesive directly to bind the film and the printed product together. Lamination belongs to a major process of post-press processing. It refers to the transparent plastic film applied to the surface of the print by hot pressing to form a 10 to 20 um film, which plays a role in protecting the printed product and increasing the gloss of the printed product.
