Abstracts

Blades and vanes in aircraft turbine engines are responsible for extracting energy from the high pressure and high temperature gas generated in combustion chamber. As such, they are designed and manufactured to withstand high pressure and temperature for long durations. To last in this tough environment, turbine blades often use different methods of cooling, such as thermal barrier coatings, internal air channels, and boundary layer cooling. Blade fatigue is a major source of failure in turbines. Fatigue is caused by the stress induced by vibration and resonance within the operating range of machines.

Based on the Commercial Aircraft Turbine Blades and Vanes market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
