Abstracts

Parachutes are devices used to reduce aerodynamic motion of an object by creating drag to drop payloads including people, equipment, bombs, and relief aids from airborne platforms. Historically, parachutes were made using lightweight silk materials; however, most modern parachutes are made using nylon or synthetic polymers. Parachutes are broadly classified into two categories such as ascending and descending canopies, where former ones are designed to provide ascend movements or lift to the flying paragliders, whereas the descending canopies are used for airdropping any object or people from airborne platforms.
