Abstracts

Compressor valves are circular and include a series of rings or plates put between the valve cover and seat. With every pressure difference, the rings or plates are pulled toward the greater pressure area and therefore use springs to come back to their initial position when pressure returns to normal range. The rings or plates are pulled toward the high pressure area and use springs to get back to their position when pressure normalizes. Compressor valves are used to allow gas flow to and from the cylinder area within any compressor. These valves operate when a pressure difference occurs.
