Abstracts

Insulation is a material designed to prevent heat or sound from being transmitted from one area to another. It is usually used to keep heat and sound in or out of a house, or to confine it to certain parts of the house. Insulation commonly incorporates materials that consist of millions of tiny pockets of air, which is a good insulator. Insulation materials are defined as those materials or combinations of materials that retard the flow of heat energy by performing one or more of the following functions: conserving energy by reducing heat loss or gain; controlling surface temperatures for personnel protection and comfort; preventing vapor flow and water condensation on cold surfaces; increasing operating efficiency of heating/ventilating/cooling, plumbing, steam process, and power systems in commercial and industrial installations; and reducing emissions of pollutants in the atmosphere.

Based on the Construction Insulation Materials market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
