## Abstracts

CRISPR (Clustered Regularly Interspaced Short Palindromic Repeat) is an RNA guided gene editing system that uses bacterially derived protein (Cas9) and a synthetic guided RNA to introduce a double strand break at a particular location within the genome.

Through this method, bacteria capture short sequences of nucleic acid from invading pathogens and combine them in CRISPR loci amidst the repeats. Small RNA's produced by transcription of CRISPR loci, guides a set of bacterial endonucleases to split the genomes of invading pathogens. This system has been adopted as a powerful technique enabling genome editing into the mainstream.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the CRISPR market covering all its essential aspects.
