Abstracts

Cross-Flow Filtration System is a highly useful downstream processing technique used in bio-manufacturing and also in the upstream process of cell harvesting (separation of cells from fermentation broth). It involves the introduced solution passing tangentially along the surface of the filter, with the pressure difference guiding constituents smaller than the pores through the filter. Tangential flow filtration is utilized in the separation and purification of a wide range of biomolecules such as antibodies, nucleic acids, and recombinant proteins. One advantage rendered by this technique is its ability to be applied to a wide range of biological fields such as immunology, protein chemistry, molecular biology, biochemistry, and microbiology, besides its adaptability to a range of volumes for separation and purification.
