## **Abstracts**

Cross-Flow Filtration System, also known as tangential flow filtration, is a highly useful downstream processing technique used in bio-manufacturing and also in the upstream process of cell harvesting (separation of cells from fermentation broth). It involves the introduced solution passing tangentially along the surface of the filter, with the pressure difference guiding constituents smaller than the pores through the filter. Tangential flow filtration is utilized in the separation and purification of a wide range of biomolecules such as antibodies, nucleic acids, and recombinant proteins. One advantage rendered by this technique is its ability to be applied to a wide range of biological fields such as immunology, protein chemistry, molecular biology, biochemistry, and microbiology, besides its adaptability to a range of volumes for separation and purification.

Based on the Cross Flow Filtration Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
