## **Abstracts**

A cryogenic pump functions by freezing oil, water vapor, and others gases out of the atmosphere within the vacuum chamber or system. Water and gases are frozen onto several arrays located inside the cryogenic pump. The cryogenic pump operates on the principle of closed cycle refrigeration. These pumps are commonly cooled by compressed helium, although they may also use liquid nitrogen, dry ice, or a built-in cryocooler. Some pumps have multiple stages at several low temperatures. The outer stages shield the coldest inner stages, and condense high boiling point gases such as water and oil, thus saving the surface area and refrigeration capacity of the inner stages for lower boiling point gases such as nitrogen.

Based on the Cryogenic Pump market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
