Abstracts

Deodorant works by killing the bacteria on your skin. This way when you sweat, there isn't enough bacteria sitting on your skin to create an odor. Antiperspirants use aluminum salts to block sweat. When the aluminum comes in contact with sweat, it turns into a gel that forms a plug over your sweat glands. This plug will reduce the amount of sweat released to the skin surface. Antiperspirants typically use some sort of aluminum to temporarily block the sweat glands from releasing moisture. Deodorants don't usually contain aluminum. Instead, they contain fragrances and antibacterials to reduce odor. Common antibacterials include alcohol, baking soda, coconut oil and cornstarch.
