Abstracts

Dermabrasion is a surgical skin resurfacing procedure performed by the dermatologist or a plastic surgeon. It is commonly used to treat deep acne scars, surgical scars, and sometimes used to remove the pre-cancerous growths known as keratosis. Procedure requires local anesthetic and is performed in the hospitals or other medical centers. Dermabrasion is also performed along with other dermatology procedures such as laser treatment. After the procedure, the skin appears bright pink which gets faded in three months.

On the other hand, microneedling is a relatively new cosmetic procedure that is used for skin regeneration and treatment of various skin conditions such as stretch marks, wrinkles, and scarring. This cosmetic procedure is considerably cheaper than other rejuvenating procedures and has the ability to promote collagen production.

Microneedling is performed using a topical anesthetic cream to ease discomfort and might take 10 to 20 minutes depending on the size of the area to be treated.
