Abstracts

Dermatoscopy (also known as dermoscopy or epiluminescence microscopy) is the examination of [skin lesions] with a 'dermatoscope'. This traditionally consists of a magnifier (typically x10), a non-polarised light source, a transparent plate and a liquid medium between the instrument and the skin, and allows inspection of skin lesions unobstructed by skin surface reflections. Modern dermatoscopes dispense with the use of liquid medium and instead use polarised light to cancel out skin surface reflections. When the images or video clips are digitally captured or processed, the instrument can be referred to as a 'digital epiluminescence dermatoscope'.

Based on the Dermatoscope market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
