Abstracts

Thermal paper is a coated processed paper. Coatings are usually made of fluorescent dyes and color-developing agents. When heated, the fluorescent dyes and color-developing agents chemically react to produce color. The color of thermal paper will gradually fade after being placed for a long time and at high temperature. Thermal paper is generally used in conjunction with thermal printers, and is often used for labels and wrapping paper for objects because of its clear printing. The biggest advantage of Direct Thermal Paper over thermal transfer printing is that it does not require a carbon ribbon, the operation is simple, and the cost of consumables is low.
