## Abstracts

Monoglycerides are a class of glycerides which are composed of a molecule of glycerol linked to a fatty acid via an ester bond. As glycerol contains both primary and secondary alcohol groups two different types of monoglycerides may be formed.

Mono DiGlycerides is commonly known as fatty acid; it is used in food products as an emulsifier. Fatty acid or mono-diglycerides are typically low in concentration. This chemical is extensively added in food commodities to enhance their shelf life. Glycerin, also referred to as glycerol or 1,2,3-propanetriol, is a polyhydric alcohol and part of triglycerides mainly found in vegetable and animal oil. Glycerin is derived either from natural resources or from petroleum feedstock. It is a byproduct generated during the manufacturing of biodiesel and soap. Some of the prominent applications of Glycerin include its use for moisture retention or as humectant in personal care. It is also used in medical formulations and industrial chemical manufacturing.
