Abstracts

The DNA probe is a basic component in most molecular diagnostic techniques. The DNA probe is a labeled DNA strand synthesized in the laboratory. Its purpose is to hybridize with the target nucleic acid molecule to be identified from a biological sample. A probe is composed of a strand of 30-40 nucleotides called oligonucleotides. These oligonucleotides are labeled with a detector molecule. When hybridization occurs between the probe and the target organism's nucleic acid, the hybrid can be detected through the detector molecule.
