Abstracts

The DNA probe is a basic component in most molecular diagnostic techniques. The DNA probe is a labeled DNA strand synthesized in the laboratory. Its purpose is to hybridize with the target nucleic acid molecule to be identified from a biological sample. A probe is composed of a strand of 30-40 nucleotides called oligonucleotides. These oligonucleotides are labeled with a detector molecule. When hybridization occurs between the probe and the target organism's nucleic acid, the hybrid can be detected through the detector molecule.

Based on the DNA Probe-based Diagnosti market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
