Abstracts

E-passports are mainly used to authenticate the identity of a traveler during international travels. This technology stores data about the traveler on a smart chip, which bears a unique identification number and a digital signature. Its use is more secure than traditional paper technology, as it reduces the risk of data duplication and alteration. The data stored electronically on the chip is authenticated by public key infrastructure (PKI), which helps eliminate forgeries. Fingerprint, facial, and iris recognition are the major biometric modalities used in this technology. Increase in thefts, illegal immigration, and transborder crimes fuels e-passport market.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the E-Passport market covering all its essential aspects.
