Abstracts

An edge server is a piece of hardware that performs data computation at the end (or 'edge') of a network. Like a regular server, an edge server can provide compute, networking, and storage functions. Edge servers process data physically close to the end-users and on-site apps, so these devices process requests faster than a centralized server. Instead of sending unprocessed data on a trip to and from a data center, these devices process raw data and return content to client machines. As a result, edge servers provide snappier performance, lower latency, shorter loading times. For example, an edge-compute server may sit between IoT devices on a factory floor and the cloud or an enterprise data center. In that case, data flows like this: IoT devices (cameras, sensors) on the factory floor send data to an edge-compute server (i.e. edge gateway).

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Edge Server market covering all its essential aspects.
