Abstracts

An effects processor and pedal is an electronic or digital device that alters the sound of a musical instrument or other audio source. Common effects include distortion/overdrive, often used with electric guitar in electric blues and rock music; dynamic effects such as volume pedals and compressors, which affect loudness; filters such as wah-wah pedals and graphic equalizers, which modify frequency ranges; modulation effects, such as chorus, flangers and phasers; pitch effects such as pitch shifters; and time effects, such as reverb and delay, which create echoing sounds. Most modern effects use solid-state electronics or computer chips. Some effects, particularly older ones such as Leslie speakers and spring reverbs, use mechanical components or vacuum tubes. Effects are often used as stompboxes, which are typically placed on the floor and controlled with footswitches. They are also built into amplifiers, tabletop units designed for DJs and record producers, and rackmounts, and are widely used as software VSTs.
