## **Abstracts**

An electron beam curing coating refers to a coating in which a film forming body is cured by electron beam irradiation. The electron beam curing coating uses an electron beam as an energy source for initiating curing. The electron beam is a high-energy electron flow with strong penetrating power and is not affected by the color of the coating. The curable thick coating can also be used for adhesives, laminates, etc. aspect. UV curing is greatly limited in the use of color lacquers, especially black lacquers and white lacquers, as well as thick coatings. Overcoming this problem with electron beam blasting instead of UV light can overcome this problem, and the reason for hindering the development of electron beam curing coatings is its equipment. The cost is high and the running cost is high. However, due to the great progress of the electron beam curing device, the electron beam accelerator, especially the development of the low energy electron beam accelerator, the cost of the electron beam curing can be gradually compared with the ultraviolet curing.

The Electron Beam Curable Coating market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
