Abstracts

Electrosurgery is the use of high-frequency alternating current to generate thermal effects through human tissues to achieve cutting and coagulation in surgery. High-frequency electrosurgery and electrocautery are the two most commonly used types of electrosurgery.

Electrocautery or thermocautery differs from the other types of electrosurgery since it does not involve passing the current through the patient. Hence, it can be safely used in patients with implanted electrical devices, such as cardiac pacemakers, implantable cardioverter-defibrillators, and deep-brain stimulators.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Electrosurgery market covering all its essential aspects.
