Abstracts

Embolization is a minimally invasive therapy to stop bleeding as well as to stop blood flow to a tumor in order to shrink it or in preparation for removal. In this procedure, some embolized particles or substances are injected into the veins of the patients to block or reduce the blood flow to cancer cells. Embolization is an option for some patients with tumors that cannot be removed by surgery. It can be used for tumors that are too large to be treated with ablation (usually larger than 5 cm thickness). It can also be used with ablation. Embolization does reduce some of the blood supply to the normal liver tissue, so it may not be a good option for some patients whose liver has been damaged by diseases such as hepatitis or cirrhosis. Embolization is used in many procedures as a part of interventional radiology.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Embolization Particle market covering all its essential aspects.
