Abstracts

The empennage is a device that is mounted at the rear of the aircraft to enhance flight stability. Most tails include horizontal and vertical tails, and a few use V-tails. The empennage can be used to control the pitch, yaw and tilt of the aircraft to change its flight attitude. The rear wing is an important part of the flight control system.

The rear wing, professionally known as spoiler, is part of the automotive aerodynamic package. The main function of the rear wing of the car is to reduce the lift of the tail of the vehicle. If the lift of the tail is larger than the lift of the front, it will easily lead to excessive steering of the vehicle, reduced grip of the rear wheel and poor high-speed stability.

Based on the Empennages market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.

In chapters 8-13, we update the timely industry economic revitalization plan of the country-wise government.
