## Abstracts

Cardiopulmonary bypass (CPB) is a technology that uses a special device to temporarily replace the human heart and lungs for blood circulation and gas exchange. After nearly 70 years of development, cardiopulmonary bypass has gradually developed into a mature clinical medical technology, including cardiopulmonary bypass (CPB), extracorporeal membrane oxygenation (ECMO), ventricular assist circulation (VAD), hemodialysis, artificial liver, etc.

At the initial stage, cardiopulmonary bypass was mainly used for heart surgery. With the continuous improvement of the technology, it has now been widely used in tumor treatment, organ transplantation, respiratory failure, poisoning, cardiac and respiratory arrest, critical illness treatment and other fields. As an interdisciplinary discipline, the specialty of cardiopulmonary bypass is characterized by strong specialization, narrow specialty, high risk, and large span of professional knowledge. The difference in technical level seriously affects the therapeutic effect of patients.
