Abstracts

As the core material of photoresist exposure, its resolution is a measure of the key dimensions (such as the line width of devices) of photoresist. The higher the resolution of photoresist, the smaller the key dimensions of graphics will be. The quality and performance of photoresist are the key factors affecting the performance, yield and reliability of integrated circuits. The cost of lithography is about 35% of the whole chip manufacturing process, and the time consumption accounts for about 40% to 50% of the whole chip manufacturing process. Photoresist materials account for about 4% of the total cost of IC manufacturing materials, and the market is huge. Therefore, photoresist is the core material of semiconductor integrated circuit manufacturing.

EUV improves the resolution during exposure by shortening the wavelength of light to meet the processing and manufacturing requirements of fine pattern lines. EUV is the most feasible solution to achieve below the 14nm node. Once EUV technology become mature, EUV photoresist will be the mainstream material for 7nm and 5nm process chips in the future, and its proportion in semiconductor manufacturing will gradually increase.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Extreme Ultraviolet (EUV) Photoresist market covering all its essential aspects.
