## Abstracts

The fusion process typically involves heating to melt or fusing the ends of the two fibers together. The splicing process begins by preparing for fusion at the end of each fiber. Fusion splicing is the act of connecting two fibers end-to-end. The goal is to fuse the two fibers together so that the light that passes through the fiber is not spliced ??or reflected back, making splicing possible. The area around it is almost as strong as the intact fiber. The heat source is usually an electric arc, but it can also be a laser, or a gas flame, or a tungsten wire through which current flows.

Fiber Splicer can be made in two ways: Mechanical joints and fusion joints are welded to form another type of fiber joint that can be manufactured. This type of joint is formed by fusing or melting the ends together. This type of joint is used to weld two fiber optic cables using an electric arc. Together, and special equipment is required to perform the joint. A protective coating from the fibers to be spliced ??is removed from the ends of the fibers. Then cut the ends of the fiber optic cable, or to give the correct terminology, cut them with a precision cutter to make sure the slit is completely vertical. The next stage involves placing two fibers into a bracket in the fiber optic adapter. First, if you check the cable with the magnified viewer, it ends. The ends of the fibers are then automatically aligned within the fiber splicer and then any dust from the area to be spliced ??is often removed by the process of using a small spark. Once the fiber optic adapter is completed, a larger spark is used to raise the temperature of the glass in the fiber above its melting point, allowing the ends to fuse together. The positional spark and the energy it contains are very tightly controlled so that the molten core and cladding do not mix to ensure that any light loss in the fibre optical joint minimizes the cladding from mixing, ensuring that the fibre optical joint is Minimize any light loss

The Fiber Splicer market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
