## Abstracts

Fibrinogen, also known as coagulation factor I, is a glycoprotein in vertebrates that helps in the formation of blood clots. Fibrinogen deficiency is a rare bleeding disorder characterized by mild to severe form of bleeding. The three types for fibrinogen deficiencies are: afibrinogenemia, hypofibrinogenemia, and dysfibrinogenemia. In severely bleeding patients, fibrinogen concentrate significantly improves whole blood clot firmness and reduces the postoperative transfusion requirements. Currently, fibrinogen concentrates are widely used instead of traditional sources of fibrinogen, such as fresh frozen plasma and cryoprecipitate.
