Abstracts

A fire collar is a type of refractory fit that maintains the integrity and fire of an insulation grade of architectural elements that have penetrated through the construction services. This may be necessary, for example, when a wall or floor is penetrated by cables, pipes, pipes, etc. In this case, the fire rating of the wall or floor can be reduced because the penetration can provide a path that allows the fire to spread beyond the compartment intended to contain it.

Typically, the fire ring includes a retaining ring that includes an intumescent material that expands upon rapid heating. The strong compressive force exerted by the intumescent material forms a fire seal that encloses the service component and forms an insulating barrier.
