Abstracts

Fish processing is a practice of combining fish and its products between the time the fish are caught and continuing until the final product made from it is delivered to the customer. The final delivered product is also ready to eat. Fish processing covers all aquatic organisms, regardless of where they are captured (wild fisheries or fish farming). One of the main concerns of the process is to prevent fish from getting worse. Fish processing is necessary because fish are perishable and therefore need to be preserved and properly treated to give the final product a nutritional quality and a longer shelf life.

Based on the Fish Processing market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
