## Abstracts

FLNG is a floating production device for the development of offshore natural gas fields. It is positioned at sea by mooring system and has the functions of mining, processing, liquefaction, storage, and loading and unloading of natural gas. Used in conjunction with liquefied natural gas (LNG) vessels for the exploitation of offshore natural gas fields and natural gas transportation. Traditional offshore gas field development is carried out using production platforms and submarine pipelines. Compared with the use of FLNG to develop natural gas fields, traditional development methods have certain limitations. If the gas field is too far away from the coast or the scale is small, the economic benefits of using traditional development methods will be reduced, and even investment will not be recovered. At the same time, if the laying of submarine pipelines is difficult, traditional development methods will be difficult to achieve.

Based on the FLNG market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
