Abstracts

Float glass is extremely smooth, distortion-free glass used in many window applications. It also provides the material for many other forms of glass, including tinted glass (heat absorbing) and laminated glass. Float glass is made by pouring the molten glass from a furnace into a chamber that contains a bed of molten tin. The process is sometimes called the Pilkington Process. The atmosphere inside the chamber is carefully controlled. The glass floats on the tin and forms itself in the shape of the container. It spreads 90 to 140 inches wide at a thickness determined at the time of manufacture.

This method gives the sheet uniform thickness and very flat surfaces. Modern windows are made from float glass. In the float glass process, the ingredients (silica, lime, soda, etc.) are first blended with cullet (recycled broken glass) and then heated in a furnace to around 1600°C to form molten glass. The molten glass is then fed onto the top of a molten tin bath.
