Abstracts

The flywheel energy storage system is an energy storage method that accelerates the rotor (flywheel) to a very high speed to store energy in the form of rotational kinetic energy in the system. When energy is released, the speed of rotation of the flywheel is reduced according to the principle of conservation of energy; and when energy is stored in the system, the speed of rotation of the flywheel is correspondingly increased. Based on the Flywheel Energy Storage (Fes) Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
