Abstracts

Functional near-infrared spectroscopy (fNIRS) is a brain imaging technology that uses low levels of non-ionizing light to record changes in cerebral blood flow in the brain through optical sensors placed on the surface of the scalp. These signals are recorded via flexible fiber optic cables, which allow neuroimaging experiments to be conducted on participants while performing tasks such as standing or walking.

fNIRS Brain Imaging System, the effects are localized within 1–2 cm of the area activated, allowing for more accurate identification of the areas from which cortical responses were obtained than electrophysiological techniques.

The fNIRS Brain Imaging System is divided into desk type and portable type, which are mainly used in university, hospital, research institution and other places.
