Abstracts

The monitor can be used to project water or fire fighting foam (or in some cases even dry chemical powder). Water monitors typically only project water, while foam monitors can be used to project water and foam. Projectors that project foam require special nozzles that allow for the induction of foam concentrate (and in the case of inhaled foam nozzles, the growth of the foam solution). Therefore, the difference between water and foam monitors is primarily due to the nozzles mounted on the monitor body (and the monitor body is common to both).

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Foam Monitor market covering all its essential aspects.
