## Abstracts

The monitor can be used to project water or fire fighting foam (or in some cases even dry chemical powder). Water monitors typically only project water, while foam monitors can be used to project water and foam. Projectors that project foam require special nozzles that allow for the induction of foam concentrate (and in the case of inhaled foam nozzles, the growth of the foam solution). Therefore, the difference between water and foam monitors is primarily due to the nozzles mounted on the monitor body (and the monitor body is common to both).

Based on the Foam Monitor market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
