Abstracts

The casting process involves heating the metal until it melts and then pouring it into a mold to form a specific shape. This process is useful when the shape of the part is complex or the part requires very large dimensions. Another advantage of castings is that processing costs can sometimes be reduced because components can be manufactured to certain specifications.

Forging is a technique where the metal is first heated, then hammered and manipulated into the final desired shape. Forgings are generally stronger than castings, but there are some restrictions on the manufacturing capabilities of forgings. The parts must not be too complicated or too complicated during forging. Generally, if a part needs to be forged and also meets certain dimensional requirements, it needs to be machined after the part is produced.

Based on the Forging and Casting market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
