Abstracts

Hydraulic fracturing or fracking is a fine-stimulation technique in which rock is fractured by the process of drilling down into the earth before a pressured water mixture is directed at the rock to release the gas inside that is a pressurized liquid called fracking fluid. Fluids used in the process are foam based, water-based, and gelled-oil-based products. Water, sand and chemicals are inoculated into the rock at more pressure that allows the gas to flow out to the head of the well. The process can be carried out steeply or, more commonly, by boring flat to the rock layer and can create new pathways to release gas or can be used to extend existing channels.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Fracking Fluids market covering all its essential aspects.
