## Abstracts

Nadroparin belongs to the class of medications known as anticoagulants or antithrombotic agents. These medications reduce the clotting ability of the blood and can reduce the risk of harmful blood clots forming in blood vessels.

Nadroparin is used to prevent and treat deep vein thrombosis (DVT). This condition leads to the formation of blood clots in the blood vessels in the leg. These blood clots can sometimes travel to the lungs and block blood vessels there, resulting in a serious condition known as pulmonary embolism.
