Abstracts

Friction welding is a solid-state welding process. The mechanical friction between the workpieces in relative motion to one another generates heat along with an additional lateral force called upset. This force is generally applied to plastically displace and fuse the materials. Friction welding is a forge welding technique, wherein no melting occurs unlike traditional processes like fusion welding.

Based on the Friction Welding Machine market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
